1 Abstract

Today's web-based technology provides a plethora of online services in nearly every industry. To get closer to the growing digital market, every vital sector is changing and building a digital face for all of its core activities. In today's environment, information flows at a breakneck pace, and duplicate measures will not benefit the individual or organization that employs them. All well-organized and well-managed enterprises today require online connectivity. One such industry is healthcare, where information should be digitized quickly and effectively. This study targets that specific area that sets the path for the development of software that facilitates the transition from paper to electronic documents. The paper narrates an idea for a webbased platform that removes the requirement for paper instructions in hospitals and suggests E-Medical Management, which will improve the efficiency of patient management, doctor schedule management, and provide universal access to patient data anywhere in the hospital.[1]
